summaries

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

     "IBOID # OF TAKEAT' ISOPORMS CONTAINING SEGMENT X2 ARE FOUND IN ADMINISTRATE TO THE STORMS CONTAINING SEGMENT X2 ARE FOUND IN ADULT HEART, LUNG AND IN PROLIFERATING SKELETAL WYOBLASTS BUT NOT IN ADULT SKELETAL WUSCLE. ISOFORMS CONTAINING SEGMENT X1 ARE EXPRESSED IN ADULT IN ADULT SKELETAL WUSCLE. ISOFORMS CONTAINING SEGMENT A ARE EXCIDENTED TO SKELETAL WUSCLE. ISOFORMS CONTAINING SEGMENT B ARE WIDELY EXPRESSED IN WUSCLE ISOFORMS CONTAINING SEGMENT A AND B ARE EXPRESSED AT WYOTENDINOUS AND NEUROWUSCULAR JUNCTIONS, ISOFORMS CONTAINING SEGMENT A NEUROWUSCULAR JUNCTIONS AND AT EXTRASYNAPTIC SITES.

- DEVELOPMENTAL STAGE: ISOFORMS ARE DEVELOPMENTALLY REGULATED DURING FORMATION OF SKELETAL MUSCLE. UNDIFFERENTIATED (REPLICATING) MYOBLASTS EXPRESS ISOFORMS CONTAINING SEGMENT B ONLY, WHEREAS DIFFERENTIATED MYOBLASTS EXPRESS ISOFORMS CONTAINING SEGMENT B ONLY, WHEREAS
                                                                     THE MYOLIBER AND FACTORISE AND ADULT MYOLIBERS. DURING MYOGENIC ON SKELETAL MYOBLASTS AND ADULT MYOFIBERS. DURING MYOGENIC ON SKELETAL MYOBLASTS AND ADULT MYOFIBERS. DURING MYOGENIC ON SKELETAL MYOBLASTS AND ADULT MYOFIBERS. DURING MYOGENIC OF MYOBLASTS, AND FACILITATE THEIR LOCALIZATION AT LAMININ-RICH SITES OF SECONDARY FIBER FORMATION. INVOLVED IN THE MAINTENANCE OF THE MYOFIBERS CYTOARCHTECTURE AS WELL AS FOR THEIR ANCHORAGE, VIABILITY AND FUNCTIONAL INTEGRITY. MICE CARRYING A ITGAT NULL ALLELE ARE VIABLE AND FERTILE, BUT SHOW PROGRESSIVE MUSCULAR DYSTROBILITY IN DIFFERENT MUSCLE TYPES.

'VARIABILITY IN DIFFERENT MUSCLE TYPES.

'SUBUNIT: HETERODIMER OF AN HENYY AND A BETA SUBUNIT. THE ALPHA SUBUNIT IS COMPOSED OF AN HENYY AND A LIGHT CHAIN LINKED BY A DISLULDIDE BOUND ALPHA A ASSOCIATES WITH BETA-1.

'SUBCELLULAR LOCATION: TYPE I membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Event—Alternative splicing; Named isoforms=6;

Comment-Additional isoforms seem to exist. There is a combination of at least four alternatively spliced domains, two extracellular (X1 and X2) and two cytoplasmic (A and B). A third potential alternatively spliced cytoplasmic (A and B). A third appear to be expressed. So far detected are isoforms alpha-7XIA, alpha-7XIB and alpha-7XIB. Experimental confirmation may be lacking for some isoforms;

                                                                                                                                                                                                                                                                                                                                                                              PIM: ADDITION OF THE STATE ON THE EXTRACELLULAR DOMAIN IN SKELETAL MYOTUBES (BY SIMILARITY).
DISEASE: DEFECTS IN ITGAT ARE ASSOCIATED WITH A FORM OF CONGENITAL MYOPATHY; A GROUP OF HETROGENEOUS MUSCLE DISORDERS WHICH ARE THOUGHT TO RESULT FROM ABNORMAL MUSCLE DEVELOPMENT. MUSCLE WEAKNESS IS EITHER NON-PROGRESSIVE OR SLOWLY PROGRESSIVE AND APPARENT FROM BIRTH OR EALLY INFANCY.
SIMILARITY: BELONGS TO THE INTEGRIN ALPHA CHAIN FAMILY.
SIMILARITY: CONTAINS 7 FG-GAP FEPERS.

Insural adhesion molecule L1 as a member of the immunoglobulin superfamily with binding domains similar to fibronectin.";

Insure 314:701-703(1988).

INALUE 314:701-703(1988).

INDEVELORMENT OF THE MERVOUS SYSTEM: INVOLVED IN NEURON ADHESION, NEURITE FASCICULATION, OUTGROWTH OF NEURITES, ETC. BINDS

TO AXONIN ON NEURONS.

IOUS SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERPAMILY.

II SIMILARITY: Contains 6 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                                                                                                               1,

'Molecular cloning and characterization of meichroacidin (male meiotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isold=Q8VIG3-2; Sequence=Not described;
Note=No experimental confirmation available;
TISSUE SPECIFICITY: Germ coll apecific. Specifically expressed in
testis, and to a lower extent in ovary. Not expressed in somatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DEVELOPMENTAL STACE: During male germ cell development it is not detected until 12 days. Significant expression is detected from 14-day-old through to adult testis. Expression is first detected in the pachytene spermatocytes at stage V, becomes stronger from the late pachytene spermatocytes to round spermatid stage, and then gradually decreases as the morphogenesis proceeds further. Not expressed in germ cells located in the first layer of the seminiferous epithelium (spermatogonia, leptotene and zygotene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SIMILARITY: Contains 6 MORN repeats.
CAUTION: Ref.1 sequence differs from that shown due to a frameshift in position 283.
                                           metaphase chromosome-associated acidic protein).";

-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-beta-D-glucosidic linkages in cellulose, lichenin and cereal beta-D-glucans.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: HYPHAL TIP.
-!- DEVELOPMENTAL STRAGE: EXPRESSED IN FILAMENTOUS DIKARYON.
-!- PTM: MAY ALSO BE O-GLYCOSYLATED.
-!- PTM: MAY BELONGS TO CELLULASE FAMILY K (FAMILY 45 OF GLYCOSYL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cellulose degradation; Hydrolase; Glycosidase; Signal; Glycoprotein. Dental product useful for treating skeletal diseases e.g. dental diseases comprises a base material and a compound comprising specific

```
The present invention relates to dental products such as toothpastes, mouthwash and dental floss comprising a base material and a compound which promotes bone growth. Such compounds are peptide sequences comprising 10-50 amino acids and containing an integrin binding motif such as RGD in the D- or L- form, preferably the L-configuration. The peptides of the invention are useful for treating or preventing skeletal diseases such as dental disease. The peptides enhance tooth and/or alveolar bone growth on areas where deterioration has occurred, as well as the growth or recruiting of esteoblast or odnitoblast cells on the surface of the new skeletal growth. AAU933681-AAU93726 represent bone growth enhancing peptides for use in dental products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bone growth; RGD motif; integrin binding motif; calcium binding motif; glycosaminoglycan binding motif; bone loss; renal phosphate excretion; alveolar; teeth; odontoblast; osteoclast; dental tissue; skeletal loss;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
motif and a calcium binding motif. The peptide of the invention is useful
             for reducing bone loss and for reducing renal phosphate excretion in an individual. The peptide is useful for promoting regeneration of alveolar bone and/or teeth, and increases the number and activity of odontoblasts /osteoclasts that help form dental tissues. The peptide is also useful for treating or preventing a condition associated with skeletal loss or weakness. This sequence represents a C-terminal amidated synthesised peptide D-00004 of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to dental products such as toothpastes, mouthwash and dental floss comprising a base material and a compound which promotes bone growth. Such compounds are peptide sequences comprising 10-50 amino acids and containing an integrin binding motif such as RGD in the D- or L- form, preferably the L-configuration. The peptides of the invention are useful for treating or preventing skeletal diseases such as dental disease. The peptides enhance tooth and/or alveolar bone growth on areas where deterioration has occurred, as well as the growth or recruiting of esteoblast or dontoblast cells on the surface of the new skeletal growth. AAU33681-AAU33726 represent bone growth enhancing peptides for use in dental products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              asseases comprises a base material and a compound comprising specific amino acid in a sequence containing the integrin binding motif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Dental product; toothpaste; mouthwash; dental floss; bone growth; integrin binding motif; RGD; skeletal disease; dental disease; tooth; alveolar bone growth; osteoblast; odontoblast; osteopathic.
                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a peptide compound capable of enhancing bone growth, and comprising 10-50 amino acids in a sequence, where the amino acids are in D- or L- conformation and the sequence comprises a motif selected from an integrin binding motif, a glycosaminoglycan binding motif and a calcium binding motif. The peptide of the invention is useful for reducing bone loss and for reducing renal phosphate excretion in an individual. The peptide is useful for promoting regeneration of alveolar bone and/or teeth, and increases the number and activity of odontoblasts for secondarion associated with skeletal loss or weakness. This sequence represents a C-terminal amidated synthesised
                                                                                                                                                                        Bone growth; RGD motif; integrin binding motif; calcium binding motif; glycosaminoglycan binding motif; bone loss; renal phosphate excretion; alveolar; teeth; odontoblast; osteoclast; dental tissue; skeletal loss;

Such compounds are peptide sequences comprising 10-50 amino acids and containing an integrin binding motif such as RGD in the D- or L- form, preferably the L-configuration. The peptides of the invention are useful for treating or preventing skeletal diseases such as dental disease. The peptides enhance tooth and/or alveolar bone growth on areas where deterioration has occurred, as well as the growth or recruiting of osteoblast or odontoblast cells on the surface of the new skeletal growth. AAU93681-AAU93726 represent bone growth enhancing peptides for use in dental products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bone growth; RGD motif; integrin binding motif; calcium binding motif; glycosaminoglycan binding motif; bone loss; renal phosphate excretion; alveolar; teeth; odontoblast; osteoclast; dental tissue; skeletal loss; weakness; matrix extracellular phosphoglycoprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Dental product useful for treating skeletal diseases e.g. dental diseases comprises a base material and a compound comprising specific amino acid in a sequence containing the integrin binding motif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Protein of matrix extracellular phosphoglycoprotein containing RGD #1.
                                                                                                                                                                                                                            Dental product; toothpaate; mouthwash; dental floss; bone growth; integrin binding motif; RGD; skeletal disease; dental disease; tooth; alveolar bone growth; osteoblast; odontoblast; osteopathic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a peptide compound capable of enhancing bone growth, and comprising 10-50 amino acids in a sequence, where the amino acids are in D- or L- conformation and the sequence comprises a motif selected from an integrin binding motif, a glycosaminoglycan binding motif and a calcium binding motif. The peptide of the invention is useful for reducing bone loss and for reducing renal phosphate excretion in an individual. The peptide is useful for promoting regeneration of alveolar bone and/or teeth, and increases the number and activity of odontoblasts for treating or preventing a condition associated with skeletal loss or weakness. This sequence represents a protein of a matrix extracellular phosphoglycoprotein containing an RGD motif of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEPE; Na+-dependent phosphate cotransport; vitamin D metabolism; bone mineralisation; phosphate metabolism related disease; hyperphosphatemia; renal osteodystrophy; renal dialysis; secondary hyperparathyrodism; osteitis fibrosa cystica; hypercalcuria; X-linked hypophosphatemic ricket; hereditary hypophosphatemic ricket; hereditary hypophosphatemic ricket; hereditary hypophosphatemic ricket; oncogenic hypophosphatemics osteomalacia; renal phosphate leakage; neceditary hypothospia; osteoporosis; vitamin D resistant rickets; end organ resistance; renal Fanconi syndrome; autosomal rickets; paget's disease; kidney failure; renal tubular acidosis; sprue.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a phosphatonin polypeptide (also called Metastatic-tumour Excreted Phosphaturic-Element (MEPE)). The level of phosphatonin in a subject modulates Na+dependent phosphate octransport, vitamin in metabolism and/or bone mineralisation. The phosphatonin polypeptides, polynucleotides, weetors and antibodies are used to treat phosphatemia, or renal osteodystrophy, hyperphosphatemia in renal dialysis/pre-dialysis, secondary hyperparathyrodism or osteitis fibrosa cystica, or X-linked hypophosphatemic rickets, hereditary hypophosphatemic rickets with hyperparathyrodism or osteitis fibrosa cystica, or X-linked hypophosphatemic rickets, hereditary hypophosphatemic costeomalacia, renal phosphate lessage, renal costeodystrophy, osteomalacia, renal phosphate lessage, renal osteodystrophy, osteoporosis, vitamin D resistant rickets, end organ resistance, renal receptores, autosomal rickets, paget's disease, kidney failure, renal tubular acidosis, cystic fibrosis or sprue. The polypeptide may also be used to manufacture combined preparations for simultaneous, dispraders a transformed cerealment of phosphate metabolism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to a novel human protein, metastatic-tumour excreted phosphaturic element (MEPE) or phosphatonin (modulator of phosphaturic element (MEPE) or phosphatonin (modulator of phosphate and vitamin-D metabolism). The phosphatonin polypeptides, of its of the phosphate or vitamin D metabolism, skeletal formation and mineralization. Phosphatoning are used to treat hyperphosphatemia, renal cetodystrophy, secondary hyperparathyroidism, ostatis fibrosa cystica or gout. It is used to prepare a medicament for treating X-linked hyperposphatemic rickets, hereditary hypophosphatemic rickets hereditary hypophosphatemic rickets hereditary hypophosphatemic rickets hereditary hypophosphatemic rickets and hypercalcuria (HHRH), hypomineralized bone lesions, stunted growth in juveniles, oncogenic hypophosphatemic osteomalacia, renal phosphate ced organ resistance, renal tubular acidosis, cystic fibrosis or disease, kidney failure, renal tubular acidosis, cystic fibrosis or express Phosphatonin golymucleotides are useful as molecular weight markers on Southern gels, as diagnostic probes for detecting the presence of a specific markers on southern gels, as diagnostic probes for detecting the presence of a specific markers on southern gels, as diagnostic probes are also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
New phosphatonin polypeptide a regulator of phosphate metabolism, for diagnosing and treating disorders of phosphate, vitamin-D metabolism, skeletal formation e.g. osteoporosis, Paget's disease, gout
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      identifying agonists and antagonists, compounds which bind to phosphatonin and drug candidates for therapy of phosphate metabolism disorders. The present sequence represents a truncated form of phosphatonin (MBPE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Osteoregulin; human; bone; homeostasis; adipose; calcification;

The present sequence is that of human osteoregulin, a novel protein which plays a role in regulating bone homeostasis, adiposity, and the calcification of atherosclerotic plaques. The sequence is predicted from the nucleotide sequence (see AAM26808) of isolated osteoblast cDNA. A splice variant of human osteoregulin was also cantibodies, host cells incoming provides novel animal cells and mammals with express heterologous osteoregulins, and animal seminal arrayeted disruption of an animal cells and mammals with a targeted disruption of an osteoregulin gene. The invention also provides screening assays to identify modulators of osteoregulin activity as well as methods of treating mammals for diseases or disorders associated with content of the manufacture of a medicament for, as well as for treating, a mammal in need of regulation of bone mass and/or density, adiposity, vascular flexibility, and/or atherosclerotic plaque calcification claimed), for treating and preventing osteoporosis, and for stimulating bone repair and regeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel osteoregulin polypeptide useful for regulating bone homeostasis, adiposity and calcification of atherosclerotic plaques comprises measuring the activity of osteoregulin -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Metastatic-tumour excreted phosphaturic element; MEPE; phosphatonin; phosphate; vitamin-D; skeletal formation; mineralization; truncated; osteopathic; antigout; cytostatic; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of human osteoregulin mature polypeptide, i.e. lacking an N-terminal signal sequence.
Colstoorgulin is a novel protein which plays a role in regulating bone homeostasis, adiposity, and the calcification of atherosclerotic plaques. 2 Splice variants of human osteoregulin were identified (see also AAB82923). The invention provides novel osteoregulin proteins, nucleic acids which encode them, vectors, animal reals and mammals with a targeted disruption of an animal real mammals with a targeted disruption of an osteoregulin gene. The invention provides screening asseys to identify modulators of osteoregulin activity as well as methods of treating mammals for diseases or disorders associated with osteoregulin activity. The modulators of activity may be useful in the manufacture of a medicament for, as well as for treating, ammmal in need of regulation of bone mass and/or density, adiposity, vacular flexibility, and/or atherosclerotic plaque calcification contential pone repair and regeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel osteoregulin polypeptide useful for regulating bone homeostasis,
  atherosclerosis; osteoporosis; osteopathic; antiarteriosclerotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Osteoregulin, human; bone; homeostasis; adipose; calcification; atherosclerosis; osteoporosis; osteopathic; antiarteriosclerotic;

This invention relates to human phosphatonin which has the activity of lowering blood phosphate and increasing urinary phosphate. The proteins are cytostatic, antidiabetic and antiinflammatory in their action. Phosphatonin down-regulates sodium-dependent phosphate transport in the kidney, it down-regulates 55-hydroxy-aitamin D3-1alpha-hydroxylase in the kidney, if down-regulates 55-hydroxy-aitamin D3-24-hydroxylase in the kidney. Phosphatonin seful in the diagnosis, treatment and prevention of phosphate metabolism related diseases such as hyperphosphaemia, arteriosclarosis, heart failure, diabetic renal disease, kidney failure, acute coronary disease and cystic fibrosis. This sequence represents human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /label= Signal_peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel human protein, metastatic-tumour excreted phosphaturic element (MEPE) or phosphatonin (modulator of phosphate and vitamin-D metabolism). The phosphatonin polypeptides, polymucleotides and specific antibodies are useful for treating a disorder of phosphate or vitamin D metabolism, skeletal formation and mineralization. Phosphatonins are used to treat hyperphosphatemia, renal osteodystrophy, secondary hyperparathyroidism, osteitis fibrosa cystica or gout. It is used to prepara medicament for treating X-linked or ypophosphatemic rickets, hereditary hypophosphatemic rickets with hypophosphatemic rickets with hypophosphatemic rickets with hypophosphatemic osteomalacia, renal posteodystrophy, osteophosphatemic rickets, renal costeodystrophy, osteophosphatemic rickets, paget's classas, kidney failure, renal tubular acidosis, vitamin-D resistant rickets, end organ resistance, renal tubular acidosis, cystic fibrosis or cystic fibrosis or sprue. Phosphatonin polymucleotides are useful as molecular weight capruse. Phosphatonin polymostic probes for detecting the presence of assess and antegonists, compounds which bind to phosphatonin and drug candidates for therapy of phosphate metabolism disorders. The present sequence represents the amino acid sequence of the entire phosphatonin (MEPE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                  New phosphatonin polypeptide a regulator of phosphate metabolism, for diagnosing and treating disorders of phosphate, vitamin-D metabolism, skeletal formation e.g. osteoporosis, Paget's disease, gout

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           designated COM1 (oncogenic osteomalacia-related factor) and its DNA molecule. COM1 protein is useful for treating a phosphate homeostasis-related disease such as X-linked hypophosphatemia rickets, oncogenic osteomalacia, rhabdomyolysis, cardiomyopathy, tumoural calcinosis and renal failure. OOM1 proteins and DNA's are useful for modulating the phenotype of a neoplastic cell associated with oncogenic osteomalacia; modulating bone mineralisation; and treating a disease characterised by abnormal bone mineralisation; and treating an oncogenic osteomalacia. Concentrations of 1,25-dihydroxy vitamin Dor osteomalacia. OOM is useful for modulating renal phosphate transport, which involves altering the activity of OOM1 within a cell and then administering serine protease it to the cell. OOM1 bNA is useful for emarching serine protease in to the cell. OOM1 bNA is useful for generating non-human transgenic animal models, and for searching and identifying single nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         population. OMM1 is useful as an immunogen to produce antibodies against COMM1 and in vitro assays to screen for agents or drugs, which modulate osteomalacia-related protein-1 (OOM-1).

Note: The present sequence states that this sequence is encoded by the DNA sequence shown in SEQ ID NO: 1 (AAD21889) of the specification. However this does not appear to be the case.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotide encoding a polypeptide useful for identifying polynucleotide expression or polypeptide activity modulators used for treating oncogenic osteomalacia, comprises the oncogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to oncogenic osteomalacia-related protein 1

                                                         The present sequence is that of human osteoregulin mature polypeptide, i.e. lacking an N-terminal signal sequence.

Costeoregulin is a novel protein which plays a role in regulating both encostants, adiposity, and the calcification of atherosclerotic plaques. 2 Splice variants of human osteoregulin exe identified (see also AAB2021). The invention provides novel osteoregulin proteins, nucleic acids which encode them, vectors, animal cells and mammals with a targeted disruption of an animal cells and mammals with a targeted disruption of an osteoregulin gene. The invention also provides screening assays to identify modulators of osteoregulin activity as well as methods of treating mammals for diseases or disorders associated with costeoregulin activity. The modulators of activity may be useful in the manufacture of a medicament for, as well as for treating, a mammal in need of regulation of bone mass and/or density, adiposity, vascular flexibility, and/or atherosclerotic plaque calcification claimed), for treating and preventing osteoporosis, and for stimulating bone repair and regeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present sequence is that of human osteoregulin, a novel protein which plays a role in regulating bone homeostasis, adiposity, and the calcification of atheroscierotic plaques. The sequence is predicted from the nucleotide sequence (see AAH56809) of isolated osteoblast cDNA. A splice variant of human osteoregulin was also identified (see AAB25200). The invention provides novel costeoregulin proteins, nucleic acids which encode them, vectors, annimal cells and mammals with a targeted disruption of an osteoregulin gene. The invention also provides screening assays to identify modulators of osteoregulin activity as well as methods to identify modulators of osteoregulin activity as useful as conferent mammals for diseases or disorders associated with the manufacture of a medicament for, as well as for treating, a mammal in need of regulation of bone mass and/or density, adiposity, vascular flexibility, and/or atherosclerotic plaque calcification (claimed), for treating and preventing osteoporosis, and for stemation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel osteoregulin polypeptide useful for regulating bone homeostasis, adiposity and calcification of atherosclerotic plaques comprises measuring the activity of osteoregulin -
                                             Osteoregulin, human, bone, homeostasis, adipose, calcification, atherosclerosis, osteoporosis, osteopathic, antiarteriosclerotic,

Sequence 31834, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: ARRUGINGS AND THERAPEUTICS

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US 60/074,788

PRIOR PILING DATE: 1999-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 31834

LENGTH: 425
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GENERAL INFORMATION:

Patent No. 6562958

GENERAL INPORMATION:

TOTALE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER

TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: NUMBER: US/09/328,352

CURRENT APPLICATION NUMBER: US/09/328,352

CURRENT FILING DATE: 1999-06-04

NUMBER OF SEQ ID NOS: 8252

SEQ ID NO 7703

LENGTH: 186

TYPE: PRT

TYPE: PRT

CORANISM: Acinetobacter baumannii
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              APPLICANT: VINCI, VICTOR A.
